

Delivery Log is a singleton class that holds relevant data about past deliveries, drivers and other relevant metrics. It also holds the user-fed fuel prices. It's calculates a "delivery score" for a set of delivery parameters based on the data it has, trying to approach a delivery that fits best the user by taking in account factors like using a vehicle that holds a lot of cargo to take too few weight or using fast vehicles in longer trips using the average trip length of past deliveries as guide.
